WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or more, except for certain cases carded for record only (chiefly venereal disease cases which are treated on a duty status, and deaths which occurred before being "admitted" to hospital or quarters). Admissions designated as "injury" comprise all traumatisms (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications). All other cases are classified as "disease", bearing in mind that under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties.

Admissions rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 25 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), total beds occupied and beds "available vacant".

Unless otherwise specified, normal bed capacity in this report is defined in Par. 36b (1) and (2) of AR40-1080, 10 December 1943, and Par. 14 WD Circular 43, 1 February 1944. This includes the T/O capacity of non-fixed hospitals but excludes convalescent facilities. Total beds include expansion beds in addition to normal beds. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in the tabulations for individual stations.

The number of beds "available vacant" is defined as 80% of the total capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. The bed capacity and beds occupied in convalescent facilities are also indicated. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 14 APRIL 1944

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

As indicated in the chart on page 3, the admission rates from all causes, from disease, and from injury all decreased slightly. Lower morbidity from respiratory causes was responsible for the decline in the admission rate from disease. For the week ending 14 April 1944, the admission rate from all causes was reported at 648 per year per thousand and the admission rate from disease was reported at 581 per thousand both being about 27 percent below the corresponding rates for the week ending 17 April 1943.

It is noteworthy that morbidity from all causes and from disease during the first two weeks of April dropped below the lowest rates reported during the summer and fall of 1943. The admission rate from injury for the week ending 14 April 1944 declined to 67 per thousand. This is about the same low level of morbidity from injury which has prevailed since the middle of January.

Respiratory Causes:

The admission rate from colds, influenza, etc. continued downward and for the week ending 14 April 1944 was reported at 166 per thousand or about 4 percent under the rate for the preceding week and nearly 45 percent lower than for the corresponding week of April 1943. The current week's morbidity from colds, influenza, etc. is comparable to that experienced in the latter part of November 1943.

The admission rate from all forms of pneumonia was reported at 14 per thousand or substantially the same as for the preceding week and about 30 percent under the rate for the corresponding week of 1943.

Common Communicable Diseases:

The admission rate for venereal disease (excluding infections existing prior to service) increased from the low figure reported for the preceding week. The number of new cases of measles, mumps, and rheumatic fever decreased slightly, while new cases of scarlet fever registered a sharp drop. The number of new cases of meningitis increased somewhat over the preceding week.

VARIATION IN MORBIDITY BY SERVICE COMMAND:

All Causes: Disease and Injury:

A marked increase in morbidity from all causes and from disease was reported from the First Service Command. Moderately higher admission rates from all causes and from disease were experienced in the Sixth Service Command. In both instances, the higher morbidity was apparently associated with troop movements. Slight increases in morbidity from all causes and from disease were also reported from the Fourth and Eighth Service Commands. The Fifth, Seventh, and Second Service Commands experienced considerably lower morbidity. In the latter Command

NON-EFFECTIVE RATE

CONTINENTAL UNITED STATES

PATIENTS REMAINING UNDER TREATMENT

CONTINENTAL UNITED STATES

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 14 APRIL 1944

COMMENT ON CURRENT TRENDS (CONT'D)

the lower admission rate from disease was entirely accounted for by lower morbidity from respiratory causes. Lower admission rates from colds, influenza, etc. were also largely responsible for the decline in morbidity in the Fifth and Seventh Service Commands.

The highest morbidity from all causes (782 per thousand) and from disease (726 per thousand) was registered in the Sixth Service Command. The Eighth Service Command continued to experience the lowest morbidity from all causes (596 per thousand) and from disease (527 per thousand).

A sharp decline in the admission rate from injuries was reported from the Ninth Service Command, which had shown a relatively high rate of morbidity from this cause in recent weeks.

Respiratory Causes:

Decreases in morbidity from colds, influenza, etc. exceeding 10 percent were reported from the Second, Third, Fifth and Seventh Service Commands. All of the other Service Commands showed relatively little change in admission rates from these causes. The Sixth Service Command continued to report the highest admission rate from colds, influenza, etc. (285 per thousand), while the lowest admission rate (129 per thousand) was again recorded by the Fourth Service Command. A sharp increase in morbidity from pneumonia was reported by the First Service Command; only the Second and Ninth Service Commands experienced lower morbidity from pneumonia as compared with the preceding week.

Common Communicable Diseases:

Markedly higher morbidity from venereal disease (excluding EPTS cases) was recorded in the Third, Seventh, and Eighth Commands. Nevertheless, the Second Service Command continued to report the highest morbidity from these causes (38 per thousand). While the total number of new cases of measles decreased slightly, there was a sharp increase in the number of new cases in the Eighth Service Command; as a result this Command accounted for 30 percent of the total number of new cases of measles or somewhat more than the Fourth Service Command. The Eighth Service Command also reported a marked increase in the number of new cases of mumps, which number however was only about half that reported by the Fourth Service Command; the latter continued to account for about 30 percent of the total number of new cases of mumps. The declines in the numbers of new cases of scarlet fever and of rheumatic fever were fairly uniformly distributed.

NON-EFFECTIVE RATE

The non-effective rate declined slightly for the seventh successive week and for the week ending 14 April 1944 was reported at 35.7 per thousand strength. This is the lowest non-effective rate experienced since August 1943. At least 10 percent of the current non-effective rate represents days lost by Army patients evacuated from overseas.

HOSPITALIZATION DATA*

CONTINENTAL UNITED STATES

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 14 APRIL 1944

COMMENT ON CURRENT TRENDS (CONT'D)

PATIENTS REMAINING UNDER TREATMENT:

The total number of Army patients remaining in hospital at the end of the week continued at about 35 per thousand strength. Thus far in 1944 the number of neuropsychiatric cases remaining has fluctuated in the range from 15,300 to 17,000 and for the week ending 14 April 1944 was reported at 15,730. The number of malaria cases under treatment has declined in recent weeks from a high of 2,230 on 25 February to 1,748 on 14 April 1944; only 27 of the 1,748 malaria cases presumably were acquired in the United States. The number of tuberculosis cases remaining under treatment was reported at 1,084 as of 14 April 1944.

CURRENT HOSPITAL CONDITIONS:

The total bed capacity as of 14 April 1944 was reported at about 382,500 or about 1,000 more than at the end of the previous week. The number of beds occupied decreased to 148,500 or 2,000 less than at the end of the preceding week, while the number of "available vacant" beds increased to almost 158,000. Total beds occupied represented 39 percent of total bed capacity. There were 8 stations with bed capacity of about 3,100 having no "available vacant" beds; one General Hospital with a bed capacity of about 1,000 was included among them.

The number of normal beds decreased by about 1,000 and as of 14 April 1944 was reported at about 293,500 or 77 percent of the total bed capacity. Included in the normal bed capacity on 14 April 1944 were 10,166 T/O hospital beds and tentage, mostly in maneuver areas, while the total bed capacity included 10,854 such beds, of which 1,134 were occupied.

The total bed capacity of General Hospitals, which has shown a steady increase in recent months, was reported at about 104,000 as of 14 April 1944. On the same date about 47,000 of these beds (or 45 percent) were occupied. The "available vacant" beds at General Hospitals numbered 36,000 as of 14 April 1944. Normal beds at General Hospitals have been maintained at a level of about 85,000 since the beginning of the year.

The total bed capacity of Station Hospitals (including the relatively small number of beds in maneuver areas mentioned above) has remained practically level since the beginning of the year at about 275,000 beds, while the normal beds in these hospitals declined sharply from 250,000 as of 7 January 1944 to 210,000 as of 14 April 1944. Total beds occupied as of 14 April 1944 numbered 101,000 or about 35 percent of the corresponding total bed capacity. Station Hospitals had 122,000 "available vacant" beds as of 14 April 1944, the highest number yet reported.

As of 14 April 1944 the bed capacity of convalescent facilities in General Hospitals numbered 10,257 beds of which 4,129 beds, or 40 percent, were occupied.

SUPPLEMENTARY HEALTH REPORT

FOR THE WEEK ENDING 31 MARCH 1944

COMMENT ON ADMISSION RATES TO HOSPITAL AND TO QUARTERS

For the week ending 31 March 1944, a special study was made to develop admission rates from disease and from injury, separately for cases which involved hospitalization and for those which involved confinement to quarters only. Accordingly, the data have been tabulated so as to include with admissions to hospital all cases originally admitted to quarters and then transferred to hospital. This procedure gives a reasonably accurate picture of the aggregate admission rate to hospital and the net admission rate to quarters for cases confined to quarters only.

For the continental United States as a whole the all causes admission rate of 660 per thousand strength was composed of rates of 598 per thousand for hospital admissions and 62 per thousand for quarters admissions (as defined above). Thus only 9 percent of the total admissions were cases involving confinement to quarters exclusively. Approximately the same proportion held for both disease and injury admissions.

In the two previous studies made for the last weeks of January and February, quarters admissions constituted 13 and 10 percent of the total admissions respectively. The corresponding figure of 9 percent for the week ending 31 March 1944 is lower chiefly because of a continued decrease in morbidity from respiratory diseases, which at many stations account for a sizeable proportion of the quarters cases.

The proportion of total admissions involving confinement to quarters only varied from a low of 7 percent in the Eighth and Ninth Service Com-

mands to a high of 21 percent in the Military District of Washington. The Seventh Service Command also had a relatively high proportion of quarters cases (14 percent). All the other Service Commands showed quarters cases in the range 9 to 11 percent of total admissions.

The most important factor affecting the proportion of quarters admissions appears to be the relative number of small units in the Service Command. Such units tend to show a relatively high proportion of total admissions in quarters. For the week ending 31 March 1944, 19 percent of the total admissions in units with a strength of less than 5000 involved confinement to quarters, exclusively, in contrast with a corresponding figure of only 6 percent for larger units. The reason for the high proportion of quarters cases in small units is that such units frequently have only dispensaries and necessarily treat in quarters many of their less seriously ill, who might otherwise have been transferred to a station hospital.

In large cities where a considerable proportion of the military personnel lives off the post, there is also a marked tendency for treatment in quarters, exemplified by the high proportion of quarters cases in the Military District of Washington.

The following stations all with strength of 5000 or more had quarters admission rates from all causes combined in excess of 400 per thousand:

Camp Hale, Colo.; Ft. Oglethorpe, Ga.; Mississippi Ordnance Plant, Miss.; Greensboro, N.C. B.T.C.; Wright Field, Ohio; Ft. Eustis, Va.
